Ok, brainstorm time. Deforestation means removel of forests over time due to mostly due to human interference. Deforestation affects many things that contribute to human's well-being indirectly in a negative way. A direct effect is observed on the biodiversity - specifically birds who roam freely in forests. Other

I realize that the year 2020 is very predictive, and the country tanzania very predictive, as both variables have distinctive natures appearantly. The variable that exists for all entries that is the most important is "net". Net change in forest size is somewhat indicative of predicting count.
